I. Features of HAC-US315 Series

1. Ultra low power transmission with 10mW as the maximal transmission power.
2. Requiring no any frequency, HAC-US315 transceivers work on ISM frequency band and the working frequency is from 305.005MHz to 321.637MHz.
3. High anti-interference and low BER (Bit error Rate)
Based on the Gaussian Frequency Shift Keying (GFSK) modulation mode, the high-efficiency forward error correction channel encoding technology is used to enhance data's resistance to both transient and random interference and the actual bit error rate of $10^{-5} \sim 10^{-6}$ can be achieved when channel bit error rate is 10^{-2} .
4. Long transmission distance
Within the visible range, when the height of antenna is higher than 2m and the bit Error Rate (BER) is 10^{-3} , the reliable transmission distance respectively is more than 800m at 1200bps. When the baud rate is 9600bps, it will be more than 500m. When the baud rate is 38400bps, it will be more than 200m.
5. Transparent data transmission
Transparent data interface used in transceiver is for meeting many standard or nonstandard user protocols. Any false data generated in air can be filtrated automatically (What has been received is exactly what has been transmitted).
6. Multi-channel
HAC-US315 transceivers offer Multi-channels in one ISM frequency band satisfying various configuration of communication under users' demand at the same time. (Channels setting is set via serial port's order, please see the concrete method in Page6)
7. 3 serial ports with 3 connection methods
HAC-US315315 provides 3 serial ports and 3 connection methods, with COM1 as the TTL level UART interface, COM2 as the nonstandard RS-232 port and Com3 as the nonstandard RS-485 port (using software analogy as the logic of RS232 and RS485, the level of COM 2 is $-0.7\sim 5.7V$ having the same use method with the standard RS232/485 and the efficient drive distance is 2m.)
Note: when the baud rate is no less than 19200bps, only TTL interface is available.
8. Large data buffer zone
The interface data rate is same with the RF baud rate: 1200, 2400, 4800, 9600, 19200, 38400bps, and 56700bps need to be customized. With data format of 8N1/8E1/8O1, users can

define by themselves. HAC-US315 can transmit large data frames and support flexible programming.

9. Intelligent data control requiring no any complicated transmission programs

Even for half duplex communication, no any excessive programs required. All RF system data transmission/reception and other On-the-Fly conversion and control are performed by HAC-US315 transceivers automatically.

10. Low power consumption & sleep function

The receiving current is less than 25mA, the transmitting current is less than 40mA, and the sleeping current is less than 5 μ A.

11. High reliability, light and small

By using monolithic radio-frequency integrated circuit and single-chip MCU, the transceivers have little peripheral circuits, high reliability, and low failure rate.

II. Applications for HAC-US315 Series

HAC-US315 Series is suitable for:

Wireless meter reading

Industrial remote control and telemetry

Automatic data collecting system

Building automatization, security, machine-house equipment wireless monitoring

POS system

Personnel positioning and alarm in the well

III. How to use HAC-US315 Series

HAC-US315 is a member of HAC series ultra low power data radio modules, which provides RS-232, RS-485 and UART/TTL level interface port for direct connection with PC, RS485 devices, monolithic processors and other UART components connection applications. The schematic diagram is shown below:

HAC-US series principle map

1. Power supply

The factory default setting is +3.3~5.5V DC. By using better ripple factor (the ripple peak should be less than 10mV), HAC-US315 transceivers can also share power supply with other equipment. If possible, a voltage-stabilizing chip with 5V voltage is more recommended as the only power supply than Switch power supply. But if only switch power supply available, the jam by switch pulse to the transceivers should be avoided. In addition, the reliable grounding must be used if there is other device in the system equipment. In case of failing to connect with the ground, it can form its own grounding but must be absolutely separated from the municipal electric supply.

Note: If the transceivers with lower power and lower consumption are required, we can lower the power supply into 2.5~3.6V product.

2. Connection Definition with terminal

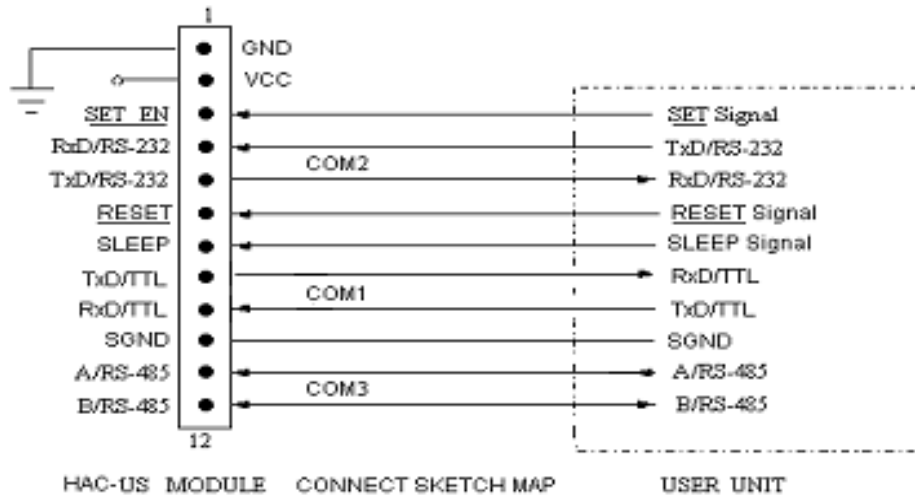

HAC-US315 transceivers supply one 12-pin connector (JP1) and one 2-pin orientation connector (JP2), the two pins can be connected with ground. The definitions and connection method of JP1 with terminals are shown in Table 1.

Table 1: Pin Definitions and connection methods

Pin	Signal Name	Function	Level	Connected to terminal	Remark
1	GND	Ground		Ground	
2	VCC	Power supply DC	+3.3~5.5V		
3	SET_EN	Enable setting	TTL		
4	RxD/RS-232	Serial data input to the transceiver	RS-232	TxD	COM2
5	TxD/RS-232	Transmitted data out of the transceiver	RS-232	RxD	COM2
6	<u>RESET</u>	Reset (input)	TTL	Negative pulse reset	Refer to 13 th part
7	SLEEP	Sleep control (input)	TTL	Sleep signal	High level sleep

8	TxD/TTL	Serial data transmitting	TTL	RxD	COM1
9	RxD/TTL	Serial data receiving	TTL	TxD	COM1
10	SGND	Signal ground			Connected with Ground
11	A/RS-485	Port A of RS 485	RS-485	A/RS-485	COM3
12	B/RS-485	Port B of RS 458	RS-485	B/RS-485	COM3

3. The connection schematic diagram of HAC-US315 transceivers with terminal

4. The function-indicator light

- a. The LED indicator light glitters for 2S once after switched on.
- b. The LED indicator light glitters continually while receiving data from air.
- c. The LED indicator light will light on continuously when the transceiver transmits data into air after receiving from COM
- d. The LED indicator light glitters continually but darker, when the transceiver is in setting mode.

5. HAC-US315 function setting

A simple configuration based on user’s needs should be made to validate the channel frequency, interface data rate, data format, sleep function and transmission power. The US315_studio software and the setting board provided by HAC can be used. Also, users can program setting

software by themselves, but the control of setting enabling (SET_EN) should be a strong consideration while programming. When being idle and SET_EN set in low level, HAC-US315 transceivers will enter into the setting mode after 1ms; When SET_EN set in high level, the transceivers will enter into work mode after 100ms.

Timing Diagram:

HAC-US315’s default setting is shown as follow:

Channel: 0 Baud rata: 9600bps Data format: 8N1 Sleeping function: Closed

Note: The user’s other specific requirement will be set before leaving factory.

The concrete Setting methods are shown as follow:

a. Interface and data format

Via 3 COM ports, the basic parameter can be set using ASCII code or Hex. (**Note: when getting in setting mode, the baud rate 9600bps and the data format 8N1 are both fixed**).

b. Command format:

	Identifier	Read-write sign	Command word	Parameter	End code
ASCII	\$	R / W	1byte	n byte	(Enter)
Hex	0x24	0x52/0x57	1byte	n byte	0x0D

Identifier: \$- Command starts

Read-write sign: R-read parameter, W-write parameter

Command word: C-channel Number, V-verifying code, B-baud rate, S-sleep function

Parameter: Refer to command paraphrase

End code: Enter –ending sign command (0x0D)

There is no distinction between capital and small letters in entire commands. If wrong input occurs, by pressing 'Backspace' (0x08) the last byte can be deleted and the command can be input again.

C. Command paraphrase

Read the current parameter. For example, the initial parameters are 0 channel, no parity, 1200bps, no sleep function. And the display is shown as follow:

Input the command:

ASCII	\$R
Hex	24 52 0D

Return :

ASCII	Channel : 0 (Channel No. : 0~31) Verifying : 8E1 (Parity bit : 8E1/8O1/8N1) Baud rate : 1200 (Baud rate : 1200~38400) Sleep : Close (Sleeping function : Close/Open)
Hex	20 20 43 68 61 6E 6E 65 6C 3A 20 30 0D 0A 20 20 20 56 65 72 69 66 79 3A 20 38 65 31 0D 0A 42 61 75 64 20 72 61 74 65 3A 20 31 32 30 30 20 0D 0A 20 20 20 20 53 6C 65 65 70 3A 20 43 6C 6F 73 65 0D 0A

To write the Channel parameter :

Input the command :

ASCII	\$WC08
Hex	24 57 43 30 38 0D

Return :

ASCII	Channel : 8 (Channel No. : 0~31)
Hex	20 20 43 68 61 6E 6E 65 6C 3A 20 38 0D 0A

Note: The new channel No. is 8. '\$WC' is the command for writing channels with parameter 00~31.

When the channel number is less than 10, the anterior '0' cannot be omitted.

To write the parity bit parameter :

Input the command :

ASCII	\$WVE
Hex	24 57 56 45 0D

Return :

ASCII	Verify : 8E1
Hex	20 20 20 56 65 72 69 66 79 3A 20 38 65 31 0D 0A

Note: The parity bit set as 8E1. '\$WV' is the command for writing channels with parameter N, O, E, which respectively represent 8N1, 8O1, 8E1. 8 and 1 means that there are 8 efficient data bits, one start bit and one stop bit.

To write the baud rate parameter :

Input the command :

ASCII	\$WBD
Hex	24 57 42 44 0D

Return :

ASCII	Baud rate : 9600
Hex	42 61 75 64 20 72 61 74 65 3A 20 39 36 30 30 20 0D 0A

Note : The baud rate set as 9600bps. '\$WB' is the command for writing channels with parameter A, B, C, D, E, F, which respectively mean: 1200bps, 2400bps, 4800bps, 9600bps, 19200bps, 38400bps.

To write the sleep parameter :

Input the command :

ASCII	\$WSO
Hex	24 57 53 4F 0D

Return :

ASCII	Sleep : Open
Hex	20 20 20 20 53 6C 65 65 70 3A 20 4F 70 65 6E 20 0D 0A

Note : Open the sleep function. '\$WS' is the command for writing channels with parameter O, C and other characters, which respectively represent opening the sleep function (O) and closing the sleep function(C).

To write the command of error :

When any error occur in identifier、read-write sign、command word, return :

ASCII	Error!
Hex	45 72 72 6F 72 21 20 0D 0A

When nothing wrong with identifier, read-write sign, but command sign wrong , return :

ASCII	Error!
Hex	(command sign :) 45 72 72 6F 72 21 20 0D 0A

Note: Red words are setting parameter, different setting leads to different return character.

6. Channel Frequency:

Channel No.	Frequency (MHz)	Channel No.	Frequency (MHz)	Channel No.	Frequency (MHz)	Channel No.	Frequency (MHz)
00	305 . 0050	08	310 . 4130	16	315 . 8210	24	321 . 2290
01	305 . 6810	09	311 . 0890	17	316 . 4970	25	321 . 9050
02	306 . 3570	10	311 . 7650	18	317 . 1730	26	322 . 5810
03	307 . 0330	11	312 . 4410	19	317 . 8490	27	323 . 2570
04	307 . 7090	12	313 . 1170	20	318 . 5250	28	323 . 9330
05	308 . 3850	13	313 . 7930	21	319 . 2010	29	324 . 6090
06	309 . 0610	14	314 . 4690	22	319 . 8770	30	325 . 2850
07	309 . 7370	15	315 . 1450	23	320 . 5530	31	325 . 9610

Note: Each channel frequency can be modified freely before leaving factory to meet user's needs.

7. Interface ports:

- i. HAC-US315 transmits the data received from air to terminal unit via serial ports, COM1, COM2 and COM3 output synchronously. Likewise, if COM1, COM2 and COM3 are respectively connected with one device, they can receive the data synchronously.
- ii. For the data sent by terminal units and ready to be transmitted into the air, HAC-US315 transceivers can only receive the data sent by one port of COM1, COM2 and COM3, but not two or three simultaneously.

Note: Only one port of COM1, COM2 , COM3 can be connected to use .

8. Attentions about data transmission:

i. Due to e a data processing will be made on users' data by HAC-US315 transceiver using FEC (Forward Error Correction) or other correction algorithm, when RxD of a HAC-US315 transceiver 'A' receives the data, then transmits it, the other one transceiver 'B' will have a delay (t_s) to receive and transmit by TxD. Different RF data rate causes different delay time. Please see the specific delay time below:

RF data rate (bps)	Delay ts (ms)	RF data rate (bps)	Delay ts (ms)
1200	115	19200	8
2400	58	38400	5
4800	30	57600	3
9600	16		

ii. When HAC-US315 is transmitting the data, there is a certain intervening time between the data sent by TxD (t_{dm}). Different baud rate leads to different intervening time (t_d). When the 'time-out' is set for TxD receiving, it should be more than maximal intervening time (t_{dm}). The specific maximal intervening times (t_{dm}) is following:

Baud rate (bps)	Max-delay tdm (ms)	Baud rate (bps)	Max-delay tdm (ms)
1200	65	19200	5
2400	33	38400	3
4800	17	57600	2
9600	9		

iii. T_s , t_{dm} , t_d Timing Diagram:

iv. Error dealing procedure:

To enhance the reliability and stability of user's system, a verify bit or a Cyclic Redundancy Check (CRC) mode is highly recommended to resent the wrong information while using

HAC-US315 series modules.

v. Large-number data transmission

In theory, when the interface data rate is faster than the RF data rate, HAC-US315 transceivers can send unlimited-long data package, but any long packages more than 120B are not recommended. The length of each package should be between 60~100B. We also recommend user to resent the wrong information using Automatic Error Request Equipment (ARQ).

The analyzing as below:

What if the actual transmission BER (Bit Error Rate) is 10^{-4} , 1 packet with 1KB data, which is about 10-thousand bits, is sent, theoretically, at least 1 bit will be received wrongly, then the 1KB information will never be received correctly.

But if we package the data into 10 packets with 100B for each, when all 10 packets are sent, there will be only 1 packet wrong according to this probability. After that, resend this wrong packet using ARQ mode. So by resending one more packet and the efficiency rate is reduced 10%, all data will be absolutely received correctly.

9. Supported protocol and Transmit capability

HAC-US315 standard transceivers offer transparent protocol to support various applications and protocols of users. If the user needs to decrease his cost or ease the workload of terminal CPU, we can add other specific functions based on the transparent protocol, such as addressing, data acquisition, command interpretation, etc.

10. Low Power Consumption (Sleep) function instruction:

Due to reducing more consumption, HAC-US315 transceivers support Sleep function. In sleep mode, the current consumption is less than $25\mu\text{A}$.

i. How to use the Sleep function:

The Pin7 'SLP' in JP1 is the signal of sleep control. In high power level, when the transceiver stays in sleep state, the conversion from idle mode to sleep will be finished in 1ms. The SLP signal can convert transceiver from idle mode to sleep in 1ms after rising edge. If the Sleep signal arrives when the transceiver is receiving or transmitting data into air, the module will enter sleep state after finishing transmission.

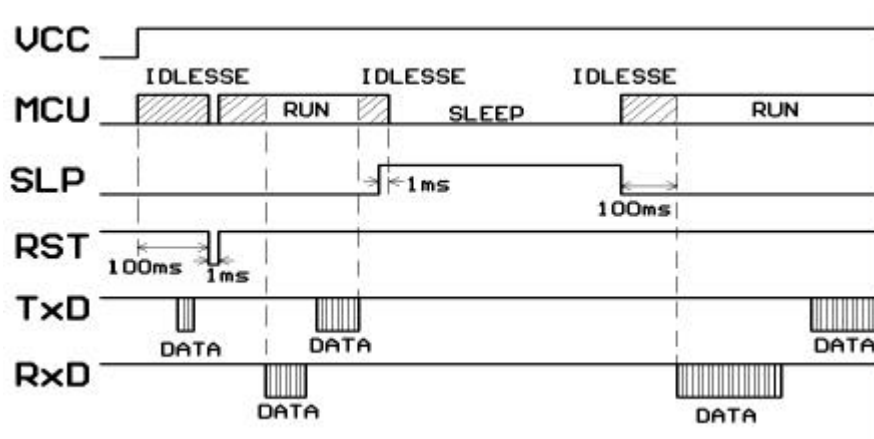

Likewise, when the SLP (SLEEP) keeps in low power level, the transceiver will work continuously. It takes less than 100ms to convert it from sleep to work mode after falling edge.

To disable the opened sleep function of HAC-US315, the SLP (SLEEP) pin should be definitely connected with 0 or ground.

ii. Attentions for use sleep function:

When the sleep function enabled, any glitches, such as switch dithering, fire striking, quick switching on and off, could cause the transceiver to be switched to the wrong sleep mode. After switching on, users can avoid this error by making a compulsive restoration once after the CPU delays 100ms. But such a condition occurs seldom.

iii. Sleep timing Diagram

11. Dimension diagram (Unit: mm):

The dimension diagram below is the factory set default of HAC-US315 transceiver. Other required smaller sizes and different shapes can also be provided.

- ii. LX315-5-SMA: 45mm helical SMA antennas with small size and beautiful appearance (like the mobile phone antenna).

- iii. LX315-10-ZSMA: 100mm SMA helical antenna with folding joint, easy for adjusting the direction and fixing.

b. Spring antennas: HAC-TH315-B, suitable for embedding in minitype equipment without metal shield, low cost.

c. Magnetic antenna: XP315-300H-SMA, include magnetic antenna base, suitable for equipment with metal shell, easy for fixing, effective to enhance the transmission distance.

If the user has special demands on antennas, we can design and produce for them specially.

13. The use of reset signal:

The reset signal is activated by low level. When inputting negative pulse more than 5ms, the module will reset. When using reset signal, if low level is needed, the controller should output low level. If high level is needed, the output of controller can't be high level and keep in high impedance state.

IV. Networking Application of HAC-US315 Series

The communication channel of HAC-US315 is half duplex, which is mostly suitable for the communication mode of point to multi-point. Under this mode, one master station must be set, and all of the rest are slave stations with a unique address. The coordination of communication is controlled by master station that uses data frames containing address code to transmit data or command. All of slave stations will receive the data and command and compare the received address code with local address code. If they are different, the data will be dismissed with no response. If they are same, it means the data is sent to the local. Slave station will make different responses according to the transmitted data or command and send the data back as response. All these jobs must be performed by upper level protocol, which will assure that there is only one transmitter-receiver in transmission mode in the communication network at any transient moment so as to avoid the cross-interference.

HAC-US315 transceivers can also be used for point-to-point communication with easier operation. For the programming of serial port, all you have to do is to remember that its communication mode is half duplex and always to observe the time sequence of come-and-go for receiving and transmitting.

V. Technical index of HAC-US315 Series

Modulation mode:	GFSK (Gaussian Frequency Shift Keying)
Working frequency:	305.005~321.637MHz (default)
Transmission power:	10dBm
Interface data format:	8N1 (default), 8E1, 8O1
Receiving sensitivity:	-110dBm@1200bps (10^{-2} BER)
Bandwidth:	50KHz (1200bps), 100KHz (9600bps), 250KHz (38400bps)
Channel interval:	676KHz
Interface baud rate:	1200, 2400, 4800, 9600 (default), 19200, 38400bps (users' setting) 57600bps customized
Working temperature:	-30 ~70
Power supply:	+3.3 ~ 5.5VDC
Dimension:	31.8mm×19.2mm×6.8mm
Transmitting current:	40mA

Receiving current : 25mA
Sleeping current : 5μA
Working humidity: 10%~90% relative humidity without condensation

VI. Explanation of type

For HAC-US315 product type, 'HAC-' indicates the name of manufacturer Shenzhen HAC Telecom Technology Co., Ltd., 'US' is the name of type, '315' is the carrier frequency.

HAC - US 315		
Manufacturer	Type	Frequency range
		315 300-348MHz
		433 400-464MHz
		868 800-900MHz
		915 900-928MHz
